1 Introduction

The purpose of this handbook is to provide comprehensive technical information on the characteristics of DP4™ and DP4B™ bearings.

The information given permits designers to establish the correct size of bearing required and the expected life and performance.

In addition, your local sales representative is available to assist you with your design.

Complete information on the range of DP4 standard stock products is given together with details of other DP4 products.

GGB is continually refining and extending its experimental and theoretical knowledge and, therefore, when using this brochure it is always worth-while to contact GGB should additional information be required.

As it is impossible to cover all conditions of operation which arise in practice, customers are advised to carry out prototype testing wherever possible.

1.1 Characteristics and Advantages

The DP4 and DP4B materials offer the following characteristics:

- Good frictional properties with negligible stick-slip
- High static and dynamic load capacity
- Suitable for rotating, oscillating, reciprocating and sliding movements
- Compact size and low weight
- Prefinished that requires no machining after assembly
- Possibility to burnish for reduced operating clearance
- No water absorption and therefore dimensionally stable
- Suitable for a wide operating temperature range from -200 to +280 °C
- DP4B with bronze backing for increased corrosion resistance
- **Lead free in compliance with European RoHS 2011/96/EC, directives (see page 51)**

In particular, depending on the dry running conditions, DP4 and DP4B materials present the following performance advantages:

Dry conditions

- Good friction and wear performance under light duty conditions
- Particularly suitable for intermittent oscillating and reciprocating movements
- Maintenance free as no external lubrication required
- Seizure resistant.

Lubricated conditions

- Good wear and friction performance over a wide range of load, speed and temperature conditions
- High wear resistance in boundary operating conditions
- High resistance of bearing surface under fluid cavitation and flow erosion conditions
- Suitable for operation in diverse fluids (oil, fuel, solvents, refrigerants, water).

1.2 Applications

Given the performance characteristics in both dry and lubricated operating conditions, DP4 and DP4B bearing materials are extensively used in a wide range of automotive and industrial applications, such as:

Automotive

Braking systems, clutches, gearbox and transmissions, hinges - door bonnet and boot, convertible roof tops, pedal systems, pumps - axial, radial, gear and vane, seat mechanisms, steering systems, struts and shock absorbers, wiper systems.

Industrial

Aerospace, agricultural, construction equipment, food and beverage, marine, material handling, office equipment, packaging equipment, pneumatic and hydraulic cylinders, railroad and tramways, textile machinery, valves.

Fig. 1: Applications for DP4 and DP4B

2 Structure and Composition

DP4 is a composite bearing material. It consists of a steel DP4/bronze DP4B backing to which is bonded a porous sinter bronze interlayer which is overlaid and impregnated with Polytetrafluoroethylene (PTFE) containing a mixture of inorganic fillers and special polymer fibres. The steel DP4/bronze DP4B backing provides mechanical strength and the bronze sinter layer provides a strong mechanical bond for the filled bearing lining.

2.1 Basic Forms

Standard Components

These products are manufactured to International, National or GGB standards. The following components are standard stock products:

- Cylindrical Bushes
- Flanged Bushes
- Thrust Washers
- Flanged Washers
- Strip Material

Fig. 4: Standard stock products

Non-Standard Components

These products are manufactured to customer's requirements and include for example:

- Modified Standard Components
- Half Bearings
- Flat Components
- Deep Drawn Parts
- Pressings
- Stampings

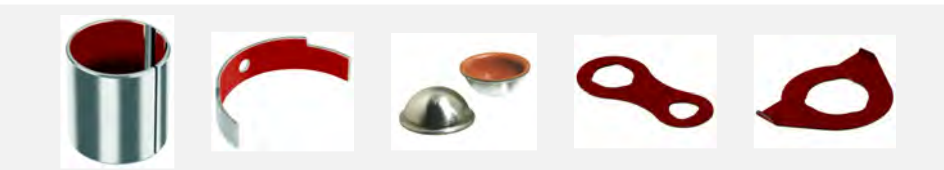

Fig. 5: Non-Standard Components

3 Properties

3.1 Physical and Mechanical Properties

		Symbol	Value		Unit	Comment
			DP4	DP4B		
Physical Properties	Coefficient of linear thermal expansion:					
	Parallel to surface	α_1	11	18	10^{-6}/K	
	Normal to surface	α_2	30	36	10^{-6}/K	
	Maximum Operating Temperature	T_{max}	+280	+280	°C	
	Minimum Operating Temperature	T_{min}	–200	–200	°C	
Mechanical Properties	Compressive Yield Strength	σ_c	350	300	MPa	measured on disc 5 mm diameter x 2.45 mm thick.
	Maximum Load					
	Static	$p_{sta,max}$	250	140	MPa	
	Dynamic	$p_{dyn,max}$	140	140	MPa	

Table 1: Physical and mechanical properties of DP4 and DP4B

3.2 Chemical Properties

The following table provides an indication of the chemical resistance of DP4 to various chemical media.

It is recommended, that the chemical resistance is confirmed by testing.

+	**Satisfactory:** Corrosion damage is unlikely to occur.
o	**Acceptable:** Some corrosion damage may occur but this will not be sufficient to impair either the structural integrity or the tribological performance of the material.
-	**Unsatisfactory:** Corrosion damage will occur and is likely to affect either the structural integrity and/or the tribological performance of the material.

	Chemical	%	°C	Rating	
				DP4	DP4B
Strong Acids	**Hydrochloric Acid**	5	20	-	-
	Nitric Acid	5	20	-	-
	Sulphuric Acid	5	20	-	-
Weak Acids	**Acetic Acid**	5	20	-	o
	Formic Acid	5	20	-	o
Bases	**Ammonia**	10	20	o	-
	Sodium Hydroxide	5	20	o	o
Solvents	**Acetone**		20	+	+
	Carbon Tetrachloride		20	+	+
Lubricants and fuels	**Paraffin**		20	+	+
	Gasolene		20	+	+
	Kerosene		20	+	+
	Diesel Fuel		20	+	+
	Mineral Oil		70	+	+
	HFA-ISO46 High Water Fluid		70	+	+
	HFC-Water-Glycol		70	+	+
	HFD-Phosphate Ester		70	+	+
	Water		20	o	+
	Sea Water		20	-	o

Table 2: Chemical resistance of DP4 and DP4B

3.3 Frictional Properties

DP4 bearings show negligible 'stick-slip' and provide smooth sliding between adjacent surfaces. The coefficient of friction of DP4 depends upon:

- The specific load p [MPa]
- The sliding speed v [m/s]
- The roughness of the mating running surface R_a [µm]
- The bearing temperature T [°C].

A typical relationship is shown in Fig. 6, which can be used as a guide to establish the actual friction under clean, dry conditions after running in.

Exact values may vary by ±20 % depending on operating conditions. Before running in, the friction may be up to 50 % higher.

After progressively longer periods of dwell under load (e.g. hours or days) the static coefficient of friction on the first movement may be between 1.5 and 3 times greater, particularly before running in.

Effect of Temperature for unlubricated applications

The coefficient of friction of DP4 varies with temperature. Typical values are shown in Fig. 7 for temperatures up to 250 °C. Friction increases at bearing temperatures below 0 °C.

Where frictional characteristics are critical to a design they should be established by prototype testing.

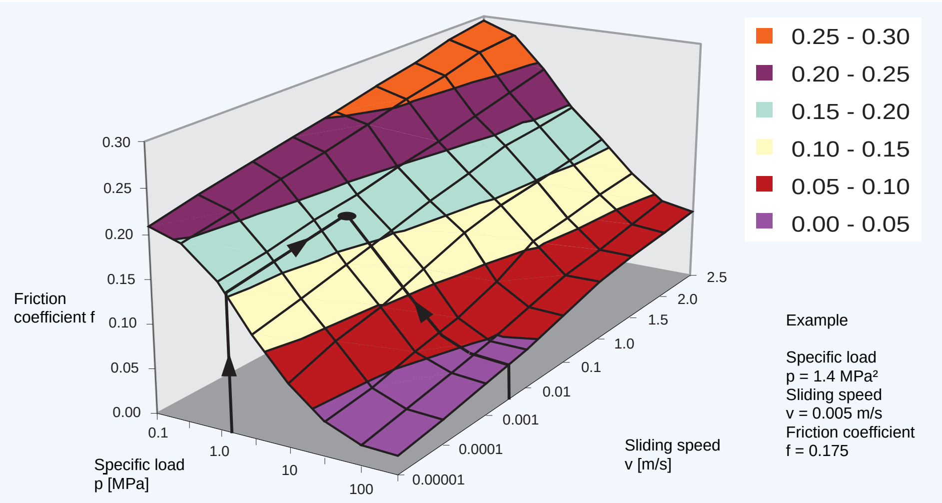

Fig. 6: Variation of friction coefficient f with specific load p and speed v at temperature T = 25 °C

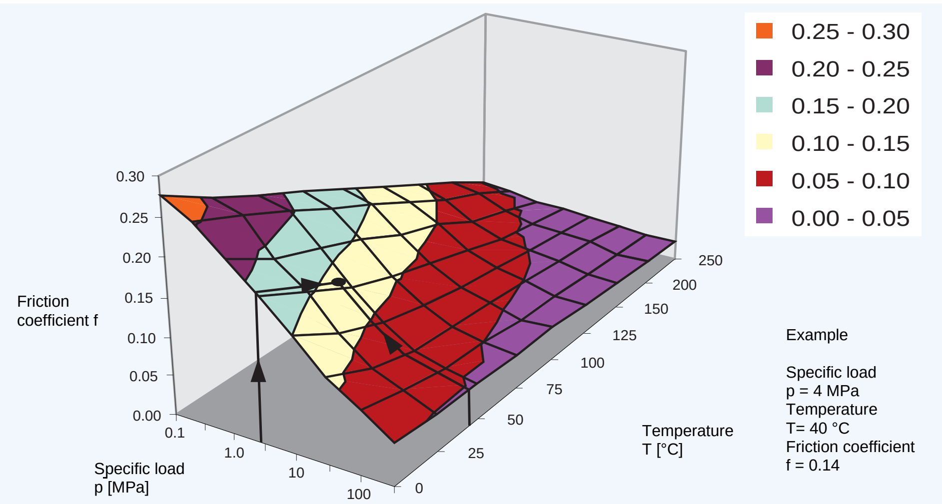

Fig. 7: Variation of friction coefficient f with specific load p and temperature T at speed v = 0.01 m/s

4 Bearing Performance

4.1 McPherson Strut Applications

DP4 has been developed to provide improved wear, erosion resistance and reduced friction in McPherson strut piston rod guide bush applications under the most demanding of operating conditions.

In the following sections, the performance of DP4 is compared with that of the material used in the majority of this type of application.

Wear and Friction Properties

The wear and frictional performance of DP4 has been evaluated in the piston rod guide bush application of a McPherson strut shock absorber using the test rig shown in Fig. 8. The test conditions are designed to simulate the operational duty of the test strut in service and differ in detail according to the strut manufacturer. The test conditions used are given in Table 3 and Table 4.

McPherson Strut Test Rig

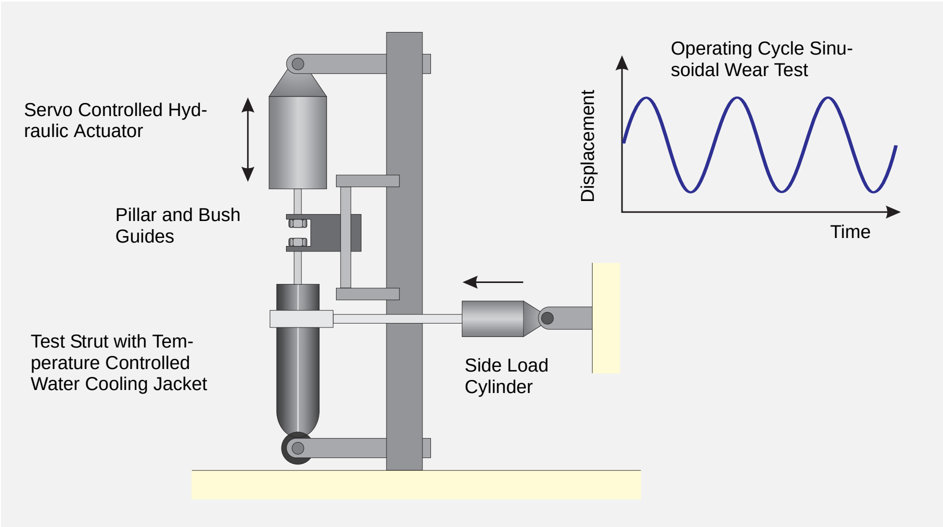

Fig. 8: Principle of the Strut Test Rig

Strut Wear - Test conditions

Waveform	Sine
Frequency	2.5 Hz
Side Load	890 N
Test Duration	100 hours
Stroke	100 mm
Mean Diametral Clearance	0.06 mm
Lubricant	TEX 0358
Foot Valve Temperature	70 °C

Table 3: McPherson strut wear test conditions

Strut Friction - Test conditions

Waveform	Sine
Frequency	0.1 Hz
Side Load	600 N
Stroke	70 mm
Mean Diametral Clearance	0.06 mm
Lubricant	TEX 0358
Foot Valve Temperature	Ambient

Table 4: McPherson strut friction test conditions

The relative wear and frictional performance of DP4 tested under these conditions are shown in Figures 9-11. Actual results for the wear rate and friction are not quoted because these depend strongly on the actual test conditions and design of the strut under test. The relative performance plots shown thus provide the best indication as to the benefits offered by DP4 in this class of application.

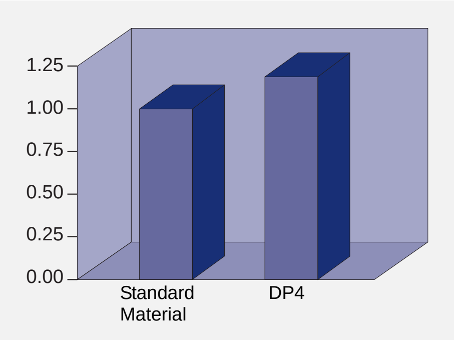

Fig. 9: Relative wear resistance

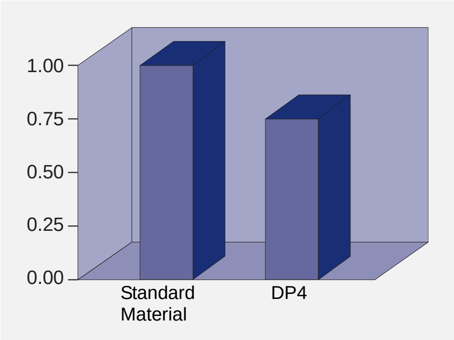

Fig. 10: Relative static friction coefficient

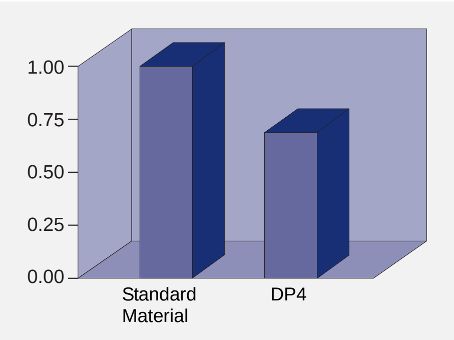

Fig. 11: Relative dynamic friction coefficient

Cavitation Erosion Resistance

Under certain operating conditions, the PTFE lining of the McPherson strut piston rod guide bush can suffer erosion damage, due to cavitation and flow erosion effects from the oil film within the bearing. The test rig shown in Fig. 12 is designed to reproduce the cavitation erosion damage to the bearing lining of the test specimen. The test conditions are given in Table 5.

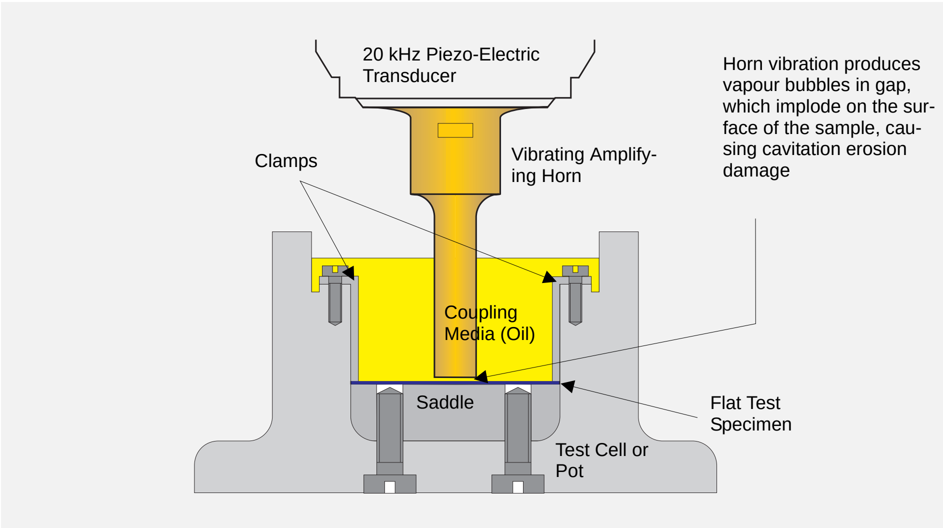

Fig. 12: Principle of the cavitation erosion test rig

Cavitation Erosion - Test Conditions

Amplitude	0.015 mm
Frequency	20 kHz
Separation	1 mm
Test Duration	30 minutes
Lubricant	TEX 0358
Temperature	Ambient

Table 5: Cavitation erosion test conditions

The relative resistance to cavitation damage of DP4 as evaluated on this test rig is shown in Fig. 13.

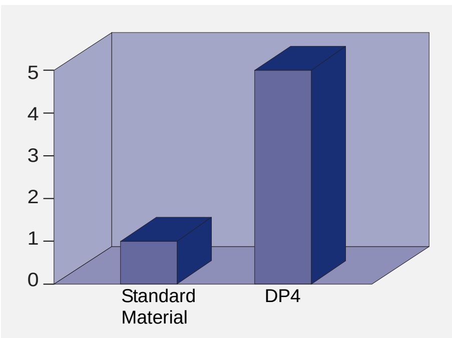

Fig. 13: Relative resistance to cavitation erosion

Flow Erosion Resistance

The test rig shown in Fig. 14 is designed to reproduce flow erosion damage to the bearing lining of the test specimen. The test conditions are given in Table 6.

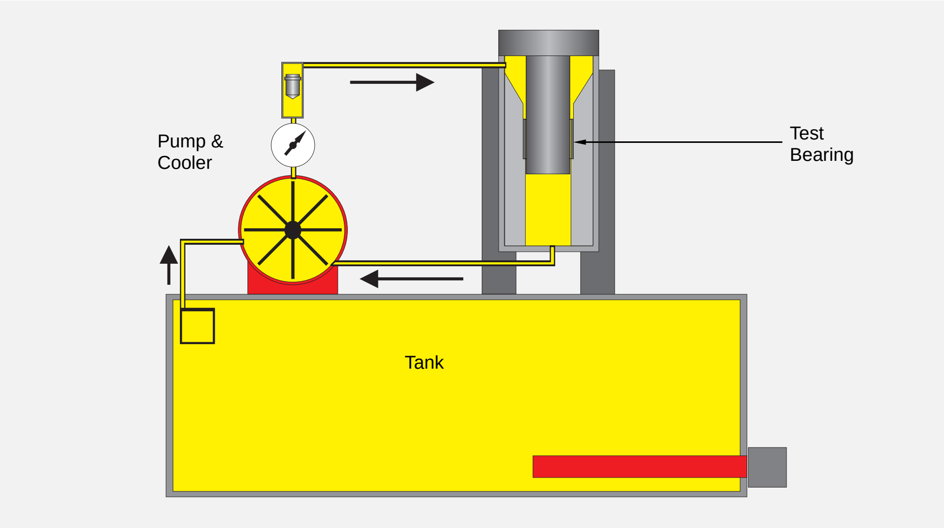

Fig. 14: Principle of the flow erosion test rig

Flow Erosion - Test Conditions

Bearing Diameter	20 mm
Bearing Length	15 mm
Diametral Clearance	0.11 mm
Pressure	13.8 MPa
Flow Rate	5 l/min
Test Duration	20 hours
Shaft Surface Finish	0.15 µm ±0.05
Temperature	Ambient

Table 6: Flow erosion test conditions

The relative resistance to flow erosion damage of DP4 as evaluated on this test rig is shown in Fig. 15.

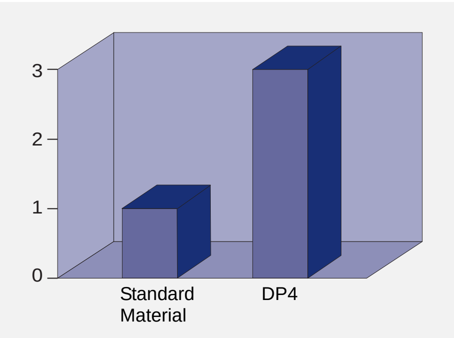

Fig. 15: Relative resistance to flow erosion

4.2 Hydraulic Applications

DP4 also shows excellent wear and frictional performance in a wide range of oil lubricated hydraulic applications.

The wear resistance of DP4 under steady load oil immersed boundary lubrication conditions has been evaluated using the test rig shown in Fig. 16. The test conditions are given in Table 7.

GGB Jupiter Test Rig

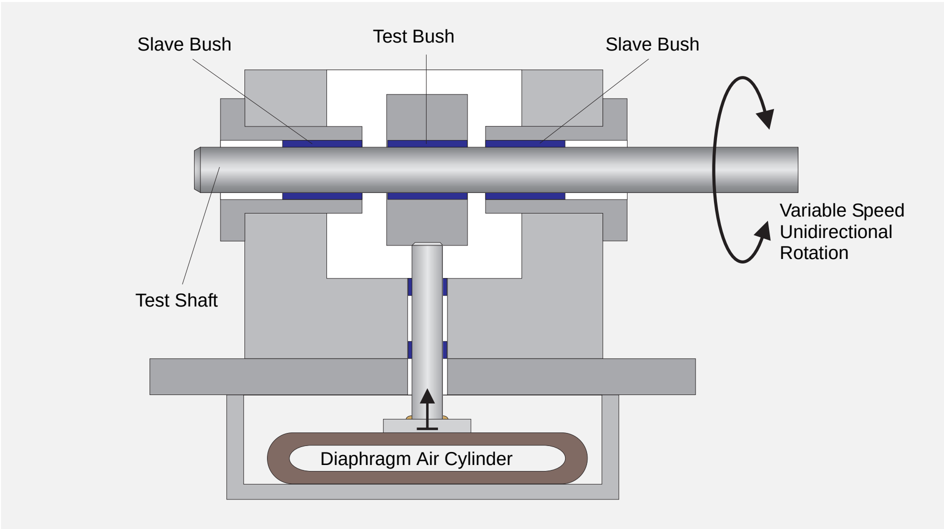

Fig. 16: Principle of the GGB Jupiter test rig

Lubricated Wear - Test Conditions

Bearing Diameter	20 mm
Bearing Length	15 mm
Mean Diametral Clearance	0.10 mm
Speed	0.11 m/s
Lubricant	ISO VG 46 hydraulic oil

Table 7: Lubricated wear test conditions

The relative pv limits with boundary lubrication of DP4 and the material used in many high performance hydraulic pump applications as determined from these tests are shown in Fig. 17. The limiting pv depends upon the actual operating conditions and hence the relative performance only is given for guidance.

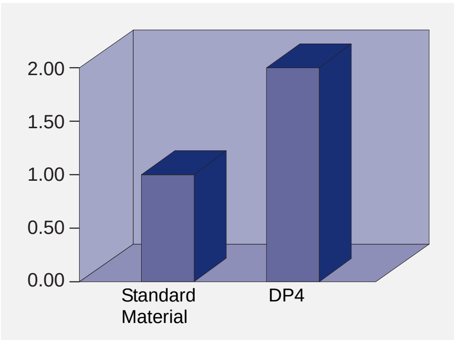

Fig. 17: Relative pv limits

4.3 Dry Wear Performance

Design Factors

The main parameters when determining the size or calculating the service life for a DP4 bearing are:

- Specific Load Limit p_{lim}
- pv Factor
- Mating surface roughness R_a
- Mating surface material
- Temperature T
- Other environmental factors e.g. housing design, dirt, lubrication

The following calculation can be used to estimate the bearing service life of DP4 under dry running conditions.

Specific Load p

For the purpose of assessing bearing performance the specific load p is defined as the working load divided by the projected area of the bearing and is expressed in MPa.

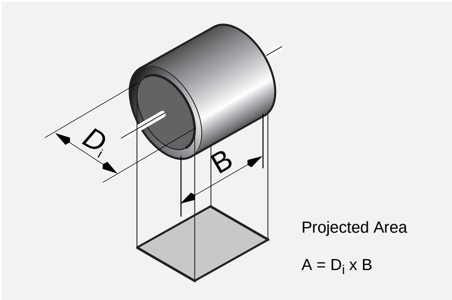

Fig. 18: Projected Area

Cylindrical Bush

(4.3.1) [MPa]

$$p = \frac{F}{D_i \cdot B}$$

Thrust Washer

(4.3.2) [MPa]

$$p = \frac{4F}{\pi \cdot (D_o^2 - D_i^2)}$$

Flanged Bush (Axial Loading)

(4.3.3) [MPa]

$$p = \frac{F}{0.04 \cdot (D_{fl}^2 - D_i^2)}$$

Slideway

(4.3.4) [MPa]

$$p = \frac{F}{L \cdot W}$$

Specific Load Limit p_{lim}

The maximum load which can be applied to a DP4 bearing can be expressed in terms of the Specific Load Limit, which depends on the type of the loading. It is highest under steady loads. Conditions of dynamic load or oscillating movement which produce fatigue stress in the bearing result in a reduction in the permissible Specific Load Limit.

In general the specific load on a DP4 bearing should not exceed the Specific Load Limits given in Table 8.

The values of Specific Load Limit specified in Table 8 assume good alignment between the bearing and mating surface (Fig. 35).

Maximum specific load p_{lim}

Type of loading	p_{lim} [MPa]									
steady load, rotating movement	140									
steady load, oscillating movement										
p_{lim}	140	140	115	95	85	80	60	44	30	20
No. of movement cycles Q	1000	2000	4000	6000	8000	10^4	10^5	10^6	10^7	10^8
dynamic load, rotating or oscillating movement										
p_{lim}	60	60	50	46	42	40	30	22	15	10
No. of load cycles Q	1000	2000	4000	6000	8000	10^4	10^5	10^6	10^7	10^8

Table 8: Specific load limit

Permanent deformation of the DP4 bearing lining may occur for specific loads above 140 MPa unless with slow intermittent movements. Under these conditions, it is recommended to contact GGB for further information.

The permissible maximum load on a thrust washer is higher than that on the flange of a flanged bush, and under conditions of high axial loads a thrust washer should be specified.

Sliding Speed v

Speeds in excess of 2.5 m/s sometimes lead to overheating, and a running in procedure may be beneficial.

This could consist of a series of short runs progressively increasing in duration from an initial run of a few seconds.

Calculation of Sliding Speed v

Continuous Rotation

Cylindrical Bush

(4.3.5) [m/s]

$$v = \frac{D_i \cdot \pi \cdot n}{60 \cdot 10^3}$$

Thrust Washer

(4.3.6) [m/s]

$$v = \frac{\frac{D_o + D_i}{2} \cdot \pi \cdot n}{60 \cdot 10^3}$$

Oscillating Movement

Cylindrical Bush

(4.3.7) [m/s]

$$v = \frac{D_i \cdot \pi}{60 \cdot 10^3} \cdot \frac{4\varphi \cdot n_{osc}}{360}$$

Thrust Washer

(4.3.8) [m/s]

$$v = \frac{\frac{D_o + D_i}{2} \cdot \pi}{60 \cdot 10^3} \cdot \frac{4\varphi \cdot n_{osc}}{360}$$

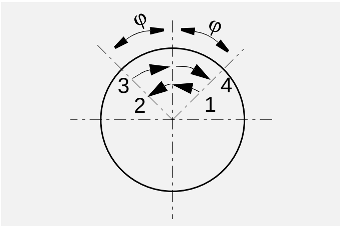

Fig. 19: Oscillating movement

pv Factor

The useful operating life of a DP4 bearing is governed by the pv factor, the product of the specific load p [MPa] and the sliding speed v [m/s].

For thrust washers and flanged bush thrust faces the rubbing velocity at the mean diameter is used.

	DP4	Unit
p	140	MPa
v	2.5	m/s
pv continuous	0.5	MPa x m/s
pv intermittent	1.0	MPa x m/s

Table 9: Typical data p, v, pv

pv factors up to 1.0 Mpa x m/s can be accommodated for short periods, whilst for continuous rating, pv factors up to 0.5 MPa x m/s can be used, depending upon the operating life required.

Calculation of pv Factor

(4.3.9) [MPa x m/s]

$$pv = p \cdot v$$

Application Factors

The following factors influence the bearing performance of DP4 and must be considered in calculating the required dimensions or estimating the bearing life for a particular application.

Temperature

The useful life of a DP4 bearing depends upon the operating temperature.

Under dry running conditions frictional heat is generated at the rubbing surface of the bearing dependent on the pv condition. For a given pv factor the operating temperature of the bearing depends upon the temperature of the surrounding environment, the heat dissipation properties of the housing and the mating surface. Intermittent operation affects the heat dissipation from the assembly and hence the operating temperature of the bearing.

The effect of temperature on the operating life of DP4 bearings is indicated by the factor a_T shown in Table 10.

Mode of Operation	Nature of housing	Temperature of bearing environment T_{amb} [°C] and Temperature application factor a_T					
		25	60	100	150	200	280
Dry continuous operation	Average heat dissipating qualities	1.0	0.8	0.6	0.4	0.2	0.1
Dry continuous operation	Light pressings or isolated housing with poor heat dissipating qualities	0.5	0.4	0.3	0.2	0.1	-
Dry continuous operation	Non-metallic housings with bad heat dissipating qualities	0.3	0.3	0.2	0.1	-	-
Dry intermittent operation (duration less than 2 min, followed by a longer dwell period)	Average heat dissipating qualities	2.0	1.6	1.2	0.8	0.4	0.2

Table 10: Temperature application factor a_T

Mating Surface

The effect of mating surface material type on the operating life of DP4 bearings is indicated by the mating surface factor a_M and life correction constant a_L shown in Table 11.

Note:

The factor values given assume a mating surface finish of $R_a = 0.4 \pm 0.1$ µm.

- A ground surface is preferred to fine turned.
- Surfaces should be cleaned of abrasive particles after polishing.
- Cast iron surfaces should be ground to $R_a = 0.3 \pm 0.1$ µm.
- The grinding cut should be in the same direction as the bearing motion relative to the shaft.

Material	Mating Surface Factor a_M	Life correction constant a_L
Steel and Cast Iron		
Carbon Steel	1	400
Carbon Manganese Steel	1	400
Alloy Steel	1	400
Case Hardened Steel	1	400
Nitrided Steel	1	400
Salt bath nitrocarburised	1	400
Stainless Steel (7-10 % Ni, 17-20 % Cr)	2	400
Cast Iron (0.3 ± 0.1 µm R_a)	1	400

Table 11: Mating surface factor a_M and life correction constant a_L

Bearing Size

The running clearance of a DP4 bearing increases with bearing diameter resulting in a proportionally smaller contact area between the shaft and bearing. This reduction in contact area has the effect of increasing the actual unit load and hence pv factor. The bearing size factor (Fig. 21) is used in the design calculations to allow for this effect.

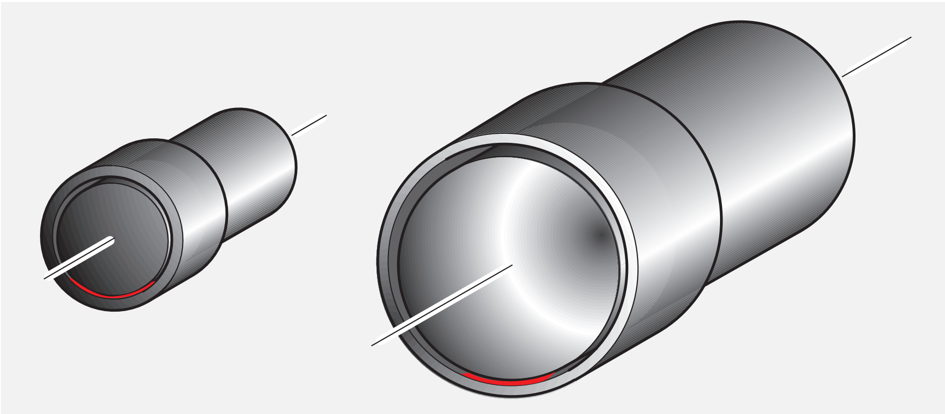

Fig. 20: Contact area between bearing and shaft

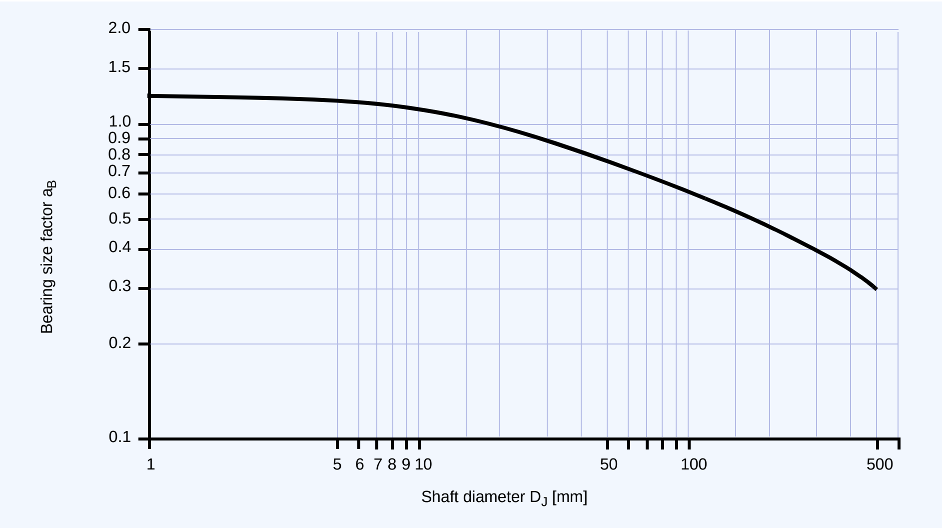

Fig. 21: Bearing size factor a_B

Bore Burnishing

Burnishing the bore of a DP4 bearing results in a reduction in the wear performance. The application factor a_C given in Table 12 is used in the design calculation to allow for this effect. Machining DP4 is not recommended.

Degree of sizing		Application factor a_C
Burnishing: Excess of burnishing tool diameter over mean bore size	0.025 mm	0.8
	0.038 mm	0.6
	0.050 mm	0.3

Table 12: Bore burnishing application factor a_C

Type of Load

The type of load is considered in formula (4.4.9), Page 20 and (4.4.10), Page 20.

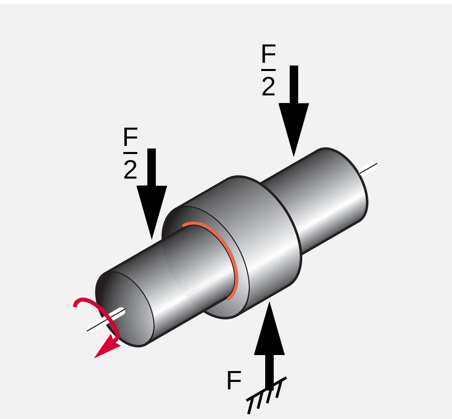

Fig. 22: Steady load, bush stationary, shaft rotating

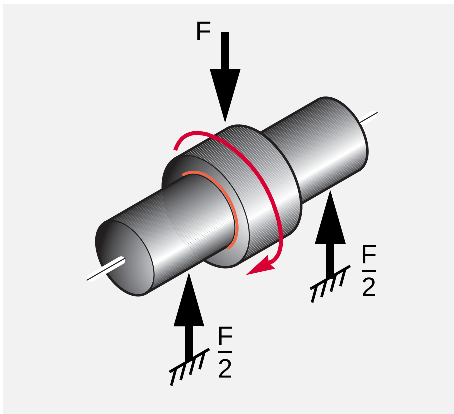

Fig. 23: Rotating load, shaft stationary, bush rotating

4.4 Calculation of Bearing Service Life

Where the size of a bearing is governed largely by the space available the following calculation can be used to determine whether its useful life will satisfy the requirements. If the calculated life is inadequate, a redesign should be considered.

Specific load p

Bushes

(4.4.1) [MPa]

$$p = \frac{F}{D_i \cdot B}$$

Flanged Bushes

(4.4.2) [MPa]

$$p = \frac{F}{0.04 \cdot (D_{fl}^2 - D_i^2)}$$

Thrust Washers

(4.4.3) [MPa]

$$p = \frac{4F}{\pi \cdot (D_o^2 - D_i^2)}$$

High load factor a_E

If a_E is negative then the bearing is overloaded. Increase the bearing diameter and/or length.

(4.4.4) [–]

$$a_E = \frac{p_{lim} - p}{p_{lim}}$$

plim see Tab. 8, page 14

Modified pv Factor

Bushes

(4.4.5) [MPa x m/s]

$$pv = \frac{5.25 \cdot 10^{-5} F \cdot n}{a_E \cdot B \cdot a_T \cdot a_M \cdot a_B}$$

Flanged Bushes

(4.4.6) [MPa x m/s]

$$pv = \frac{6.5 \cdot 10^{-4} F \cdot n}{a_E \cdot (D_{fl} - D_i) \cdot a_T \cdot a_M \cdot a_B}$$

Thrust Washers

(4.4.7) [MPa x m/s]

$$pv = \frac{3.34 \cdot 10^{-5} F \cdot n}{a_E \cdot (D_o - D_i) \cdot a_T \cdot a_M \cdot a_B}$$

For oscillating movement, calculate the average rotational speed.

(4.4.8) [1/min]

$$n = \frac{4\varphi \cdot n_{osc}}{360}$$

Estimation of bearing life L_H

Bushes (Steady load)

(4.4.9) [h]

$$L_H = \frac{265}{pv} - a_L$$

Bushes (Rotating load)

(4.4.10) [h]

$$L_H = \frac{530}{pv} - a_L$$

Flanged Bushes (Axial load)

(4.4.11) [h]

$$L_H = \frac{175}{pv} - a_L$$

a_L see Table 11, Page 18

Thrust Washers

(4.4.12) [h]

$$L_H = \frac{175}{pv} - a_L$$

Bore Burnishing

If the DP4 bush is bore burnished then this must be allowed for in estimating the bearing life by the application factor a_C (Table 12, Page 19).

Estimated Bearing Life

(4.4.13) [h]

$$L_H = L_H \cdot a_C$$

a_C see Table 12, Page 19

For Oscillating Movements or Dynamic loads

Calculate estimated number of cycles Z_T

(4.4.14) [cycles]

$$Z_T = L_H \cdot n_{osc} \cdot 60$$

(4.4.15) [cycles]

$$Z_T = L_H \cdot C \cdot 60$$

If the required bearing life is known, the total number of cycles can be determined.

Check that Z_T is less than total number of cycles Q for the operating specific load p_{lim} (Table 8, Page 16).

If Z_T <Q, bearing life will be limited by wear after Z_T cycles.

If Z_T >Q, bearing life will be limited by fatigue after Z_T cycles.

Slideways

Specific load factor

(4.4.16) [–]

$$a_{E1} = A - \frac{F}{p_{lim}}$$

If negative the bearing is overloaded and the bearing area should be increased.

Speed, temperature and material application factor

(4.4.17) [–]

$$a_{E2} = \frac{280 \cdot a_T \cdot a_M}{F \cdot v}$$

a_T see Table 10, Page 17
a_M see Table 11, Page 18

Relative contact area factor

(4.4.18) [–]

$$a_{E3} = \frac{A}{A_M}$$

Estimated bearing life

(4.4.19) [–]

$$L_H = a_{E1} \cdot a_{E2} \cdot a_{E3} - a_L$$

Note:

Estimated bearing lives greater than 4000 hours are subject to error due to inaccuracies in the extrapolation of test data.

4.5 Worked Examples

Cylindrical Bush

Given:			
Load Details	Steady Load	Inside Diameter D_i	40 mm
	Continuous Rotation	Length B	30 mm
Shaft	Steel	Bearing Load F	5000 N
	Unlubricated at 25 °C	Rotational Speed N	25 1/min

Calculation Constants and Application Factors		
Specific Load Limit p_{lim}	140 MPa	(Table 8, Page 16)
Application Factor a_T	1.0	(Table 10, Page 17)
Material Application Factor a_M	1.0	(Table 11, Page 18)
Bearing Size Factor a_B	0.85	(Fig. 21, Page 19)
Life Correction Constant a_L	400	(Table 11, Page 18)

Calculation	Ref	Value
Specific Load p [MPa]	(4.4.1), Page 20	$p=\frac{F}{D_i \cdot B}=\frac{5000}{40 \cdot 30}=4.17$
Sliding Speed v [m/s]	(4.3.5), Page 16	$v=\frac{D_i \cdot \pi \cdot n}{60 \cdot 10^3}=\frac{40 \cdot 3.14 \cdot 25}{60 \cdot 10^3}=0.052$
High Load Factor a_E [-] (must be >0)	(4.4.4), Page 20	$a_E=\frac{p_{lim}-p}{p_{lim}}=\frac{140-4.17}{140}=0.97$
Modified pv Factor [MPa x m/s]	(4.4.5), Page 20	$pv=\frac{5.25 \cdot 10^{-5} \cdot F \cdot n}{a_E \cdot B \cdot a_T \cdot a_M \cdot a_B}=\frac{6.5625}{24.265}=0.27$
Life L_H [h]	(4.4.9), Page 20	$L_H=\frac{265}{pv}-a_L=\frac{265}{0.27}-400=581$

Thrust washer

Given:			
Load Details	Axial Load	Inside Diameter D_i	38 mm
	Continuous Rotation	Outside Diameter D_o	62 mm
Shaft	Steel	Bearing Load F	6500 N
	Unlubricated at 25 °C	Rotational Speed N	10 1/min

Calculation Constants and Application Factors		
Specific Load Limit p_{lim}	140 MPa	(Table 8, Page 16)
Application Factor a_T	1.0	(Table 10, Page 17)
Material Application Factor a_M	1.0	(Table 11, Page 18)

5 Lubrication

DP4 provides excellent performance in lubricated applications. The following sections describe the basics of lubrication and provide guidance on the application of DP4 in such environments.

5.1 Lubricants

DP4 can be used with most fluids including:

- water
- lubricating oils
- engine oil
- turbine oil
- hydraulic fluid
- solvent
- refrigerants

In general, the fluid will be acceptable if it does not chemically attack the filled PTFE overlay or the porous bronze interlayer.

Where there is doubt about the suitability of a fluid, a simple test is to submerge a sample of DP4 material in the fluid for two to three weeks at 15-20 °C above the operating temperature.

The following will usually indicate that the fluid is not suitable for use with DP4:

- A significant change in the thickness of the DP4 material,
- A visible change in the bearing surface other than some discolouration or staining,
- A visible change in the microstructure of the bronze interlayer.

5.2 Tribology

There are three modes of lubricated bearing operation which relate to the thickness of the developed lubricant film between the bearing and the mating surface:

- Hydrodynamic lubrication
- Mixed film lubrication
- Boundary lubrication.

These three modes of operation depend upon:

- Bearing dimensions
- Clearance
- Load
- Speed
- Lubricant Viscosity
- Lubricant Flow

Hydrodynamic lubrication

Characterised by:

- Complete separation of the shaft from the bearing by the lubricant film
- Very low friction and no wear of the bearing or shaft since there is no contact
- Coefficients of friction of 0.001 to 0.01

Hydrodynamic conditions occur when

(5.2.1) [MPa]

$$p \leq \frac{v \cdot \eta}{7.5} \cdot \frac{B}{D_i}$$

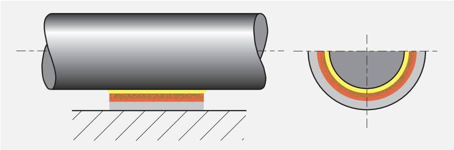

Fig. 24: Hydrodynamic lubrication

Mixed film lubrication

Characterised by:

- Combination of hydrodynamic and boundary lubrication.
- Part of the load is carried by localised areas of self pressurised lubricant and the remainder supported by boundary lubrication.
- Friction and wear depend upon the degree of hydrodynamic support developed.
- DP4 provides low friction and high wear resistance to support the boundary lubricated element of the load.

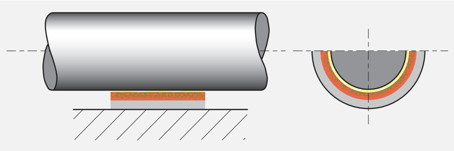

Fig. 25: Mixed film lubrication

Boundary lubrication

Characterised by:

- Rubbing of the shaft against the bearing with virtually no lubricant separating the two surfaces.
- Bearing material selection is critical to performance.
- Shaft wear is likely due to contact between bearing and shaft.
- The excellent properties of DP4 material minimises wear under these conditions.
- The dynamic coefficient of friction with DP4 is typically 0.05 to 0.3 under boundary lubrication conditions.
- The static coefficient of friction with DP4 is typically slightly above the dynamic coefficient of friction under boundary lubrication conditions.

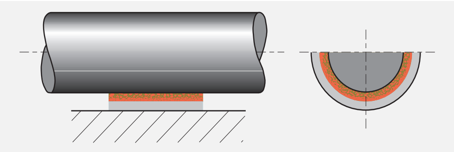

Fig. 26: Boundary lubrication

5.3 Characteristics of Lubricated Bearings

DP4 is particularly effective in the most demanding of lubricated applications where full hydrodynamic operation cannot be maintained, for example:

- **High load conditions**
  In highly loaded applications operating under boundary or mixed film conditions DP4 shows excellent wear resistance and low friction.
- **Start up and shut down under load**
  With insufficient speed to generate a hydrodynamic film the bearing will operate under boundary or mixed film conditions.
  - DP4 minimises wear
  - DP4 requires less start-up torque than conventional metallic bearings.
- **Sparse lubrication**
  Many applications require the bearing to operate with less than the ideal lubricant supply, typically with splash or mist lubrication only.
  DP4 requires significantly less lubricant than conventional metallic bearings.
- **Non lubricating fluids**
  DP4 operates satisfactorily in low viscosity and non lubricating fluids such as water and some process fluids.

Note the following however:

If a DP4 bearing is required to run dry after running in water under non hydrodynamic conditions then the wear resistance will be substantially reduced due to an increased amount of bedding in wear.

Fig. 27, Page 25 shows the three lubrication regimes discussed above plotted on a graph of sliding speed vs the ratio of specific load to lubricant viscosity.

In order to use Fig. 27

- Using the formula in Section 4:
  - Calculate the specific load p,
  - Calculate the shaft surface speed v.
- Using the viscosity temperature relationships presented in Table 13:
  - Determine the viscosity in centipoise of the lubricant.

Note:

Viscosity is a function of operating temperature. If the operating temperature of the fluid is unknown, a provisional temperature of 25 °C above ambient can be used.

5.4 Design Guidance

Temperature [°C]	Dynamic viscosity η [cP]

Table 13: Dynamic viscosity

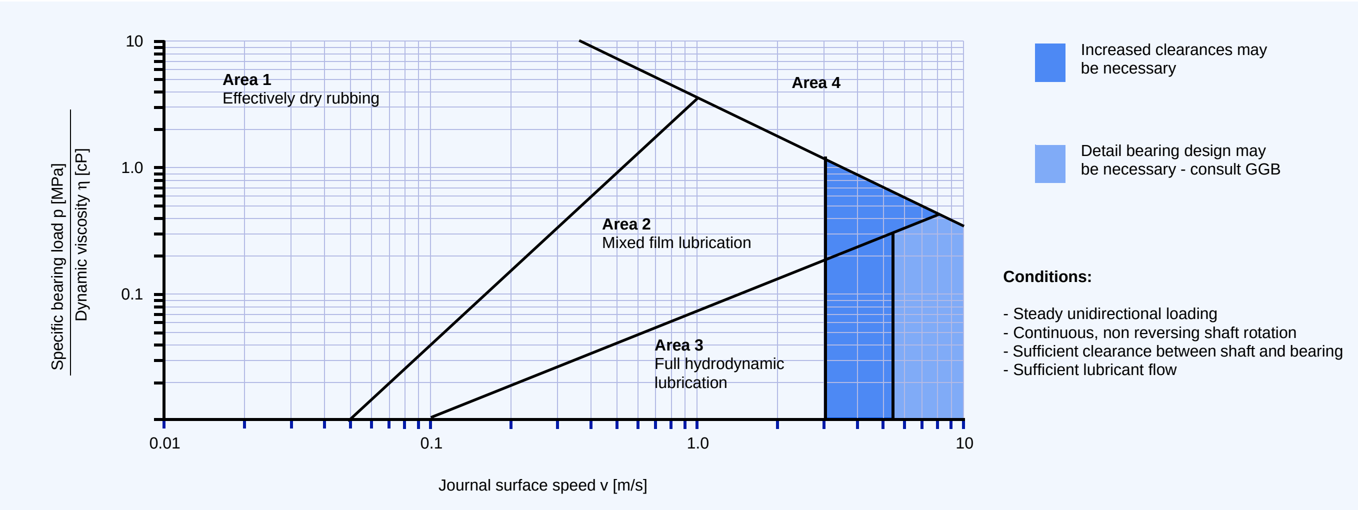

Fig. 27: Design guide for lubricated application

Explanation to Fig. 27

Area 1

The bearing will operate with boundary lubrication and pv factor will be the major determinant of bearing life. DP4 bearing performance can be calculated using the method given in Section 4, although the result will probably underestimate the bearing life.

Area 2

The bearing will operate with mixed film lubrication and pv factor is no longer a significant parameter in determining the bearing life. DP4 bearing performance will depend upon the nature of the fluid and the actual service conditions.

Area 3

The bearing will operate with hydrodynamic lubrication. Bearing wear will be determined only by the cleanliness of the lubricant and the frequency of start up and shut down.

Area 4

These are the most demanding operating conditions. The bearing is operated under either high speed or high bearing load to viscosity ratio, or, a combination of both.

These conditions may cause

- excessive operating temperature and/or
- high wear rate.

Bearing performance may be improved by the addition of one or more grooves to the bearing and a shaft surface finish <0.05 µm R_a.

5.5 Clearances for lubricated operation

The recommended shaft and housing diameters given for standard DP4 bushes will provide sufficient clearance for applications operating with boundary lubrication.

For bearings operating with mixed film or hydrodynamic lubrication it may be necessary to improve the fluid flow through the bearing by reducing the recommended shaft diameter by approximately 0.1 %, particularly when the shaft surface speed exceeds 2.5 m/s.

5.6 Grooving for lubricated operation

In demanding applications an axial oil groove will improve the performance of DP4. Fig. 28 shows the recommended form and location of a single groove with respect to the applied load and the bearing split. GGB can manufacture special DP4 bearings with embossed or milled grooves on request.

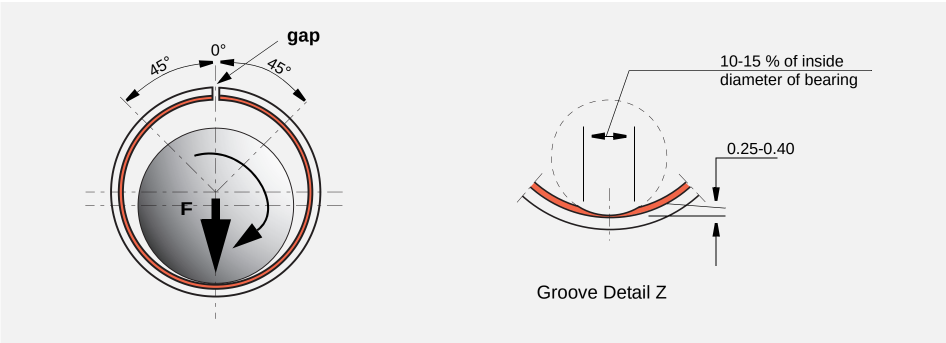

Fig. 28: Location of grooves

5.7 Mating Surface Finish for lubricated operation

- R_a = 0.4 ± 0.1 µm Boundary lubrication
- R_a = 0.1 - 0.2 µm Mixed film or hydrodyamic conditions
- R_a ≤ 0.05 µm for the most demanding operating conditions.

5.8 Grease Lubrication

DP4 is not generally recommended for use with grease lubrication. In particular the following must be avoided:

- Dynamic loads - which can result in erosion of the PTFE bearing surface.
- Greases with EP additives or fillers such as graphite or MoS_2 which can cause rapid wear of DP4.

Under grease lubrication, improved performance can be obtained by the use of other GGB metal polymer bearing materials, for example, DX®, DX®10 with DuraStrong™ technology, DS™, HX™.

Please contact your local sales representative or consult www.ggbearings.com for more details.

6 Bearing Assembly

Dimensions and Tolerances

DP4 bushes are prefinished and excluding very exceptional circumstances, must not be broached, machined or otherwise modified in the bore. It is essential that the correct running clearance is used and that both the diameter of the shaft and the bore of the housing are finished to the limits given in the tables. Under dry running conditions any increase in the clearances given will result in a proportional reduction in performance.

If the bearing housing is unusually flexible the bush will not close in by the calculated amount and the running clearance will be more than the optimum. In these circumstances the housing should be bored slightly undersize or the journal diameter increased, the correct size being determined by experiment.

Where free running is essential, or where light loads (less than 0.1 MPa) prevail and the available torque is low, increased clearance is required and it is recommended that the shaft size quoted in the table be reduced by 0.025 mm.

6.1 Allowance for Thermal Expansion

For operation in high temperature environments the clearance should be increased by the amounts indicated by Fig. 29 to compensate for the inward thermal expansion of the bearing lining.

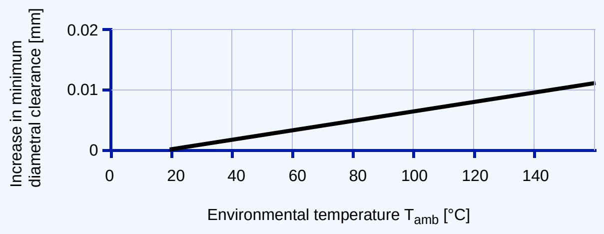

Fig. 29: Increase in diametral clearance

If the housing is non-ferrous then the bore should be reduced by the amounts given in Table 14, in order to give an increased interference fit to the bush, with a similar reduction in the journal diameter additional to that indicated by Fig. 29.

Housing material	Reduction in housing diameter per 100 °C rise	Reduction in shaft diameter per 100 °C rise
Aluminium alloys	0.1 %	0.1 % + values from Fig. 29
Copper base alloys	0.05 %	0.05 % + values from Fig. 29
Steel and cast iron	–	values from Fig. 29
Zinc base alloys	0.15 %	0.15 % + values from Fig. 29

Table 14: Allowance for high temperature

6.2 Tolerances for minimum clearance

Where it is required to keep the variation of assembled clearance to a minimum, closer tolerances can be specified towards the upper end of the journal tolerance and the lower end of the housing tolerance.

If housings to H6 tolerance are used, then the journals should be finished to the following limits.

D_i	D_J
>5 mm <25 mm	-0.019 to -0.029
>25 mm < 50 mm	-0.021 to -0.035

Table 15: Shaft tolerances for use with H6 housings

The sizes in Table 16 give the following nominal clearance range.

D_i	C_D
10 mm	0,009 to 0,080
50 mm	0,011 to 0,134

Table 16: Clearance vs bearing diameter

Burnishing

The burnishing of the bore of an assembled DP4 bush enables a smaller clearance variation to be obtained. Fig. 30 shows a recommended burnishing tool design for the burnishing of DP4 bushes.

The coining section of the burnishing tool should be case hardened (case depth 0.6-1.2 mm, HRC 60±2) and polished with diamond paste ($R_Z \approx 1$ µm). A TiN type surface treatment increases the wear resistance of the burnishing tool and when absent gives a visual indication of burnishing tool wear.

Note: Ball burnishing or fine boring of DP4 bushes is not recommended.

Assembled bush Inside-∅	Required bush Inside-∅	Required burnishing tool-∅ D_C
$D_{i,a}$	$D_{i,a}$ + 0.025	$D_{i,a}$ + 0.06
$D_{i,a}$	$D_{i,a}$ + 0.038	$D_{i,a}$ + 0.08
$D_{i,a}$	$D_{i,a}$ + 0.050	$D_{i,a}$ + 0.1

Table 17: Burnishing Tool Tolerances

The values given in Table 17 indicate the dimensions of the burnishing tool required to give specific increases in the bearing bore diameter.

Exact values must be determined by test.

The reduction in bearing performance as a result of burnishing is allowed for in the bearing life calculation by the application factor a_C (Table 12, Page 19). The impact of burnishing on the bearing and assembly should be validated by trials.

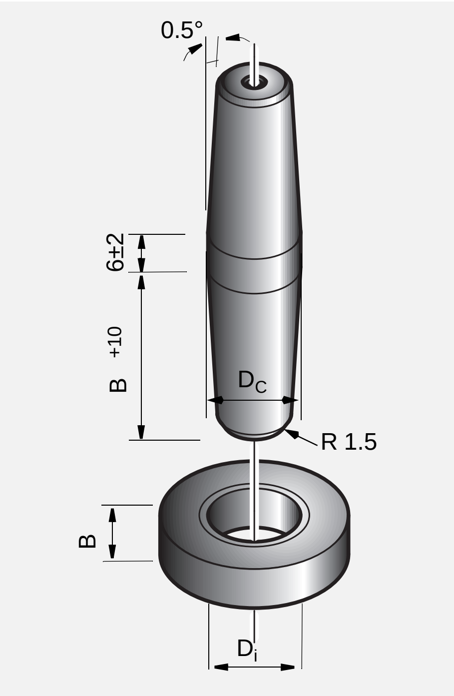

Fig. 30: Burnishing Tool

6.3 Counterface Design

The suitability of mating surface materials and recommendations of mating surface finish for use with DP4 are discussed in detail on page 16.

DP4 is normally used in conjunction with ferrous journals and thrust faces, but in damp or corrosive surroundings, particularly without the protection of oil or grease, stainless steel, hard chromium plated mild steel, or hard anodised aluminium is recommended. When plated mating surfaces are specified the plating should possess adequate strength and adhesion, particularly if the bearing is to operate with high fluctuating loads.

The shaft or thrust collar used in conjunction with the DP4 bush or thrust washer must extend beyond the bearing surface in order to avoid cutting into it. The mating surface must also be free from grooves or flats, the end of the shaft should be given a lead-in chamfer and all sharp edges or projections which may damage the soft overlay of the DP4 must be removed.

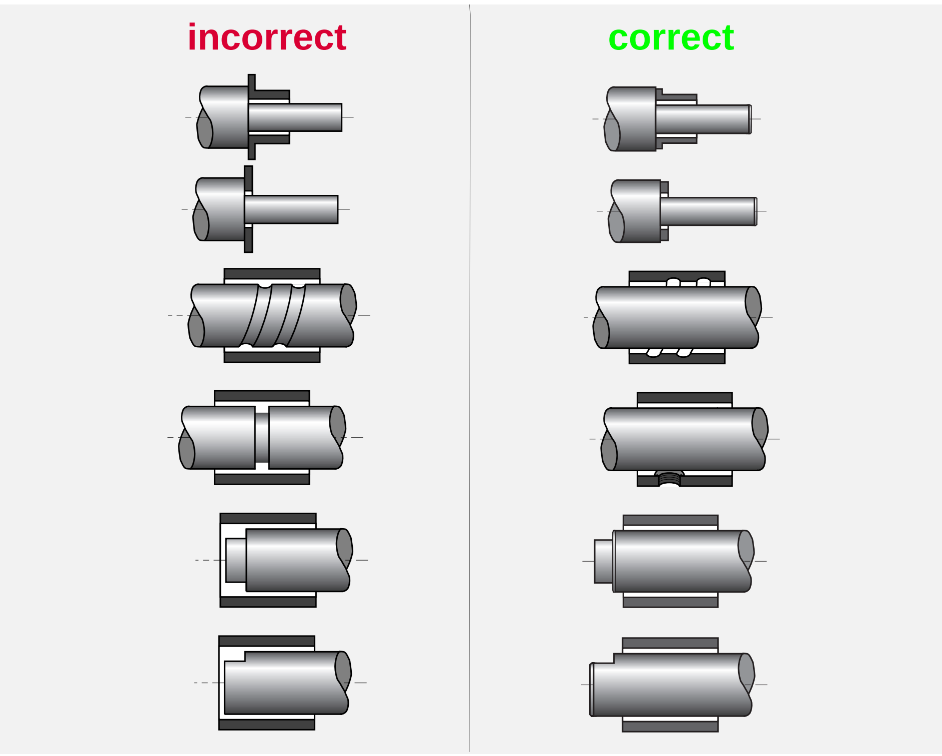

Fig. 31: Counterface design

6.4 Installation

Fitting of cylindrical Bushes

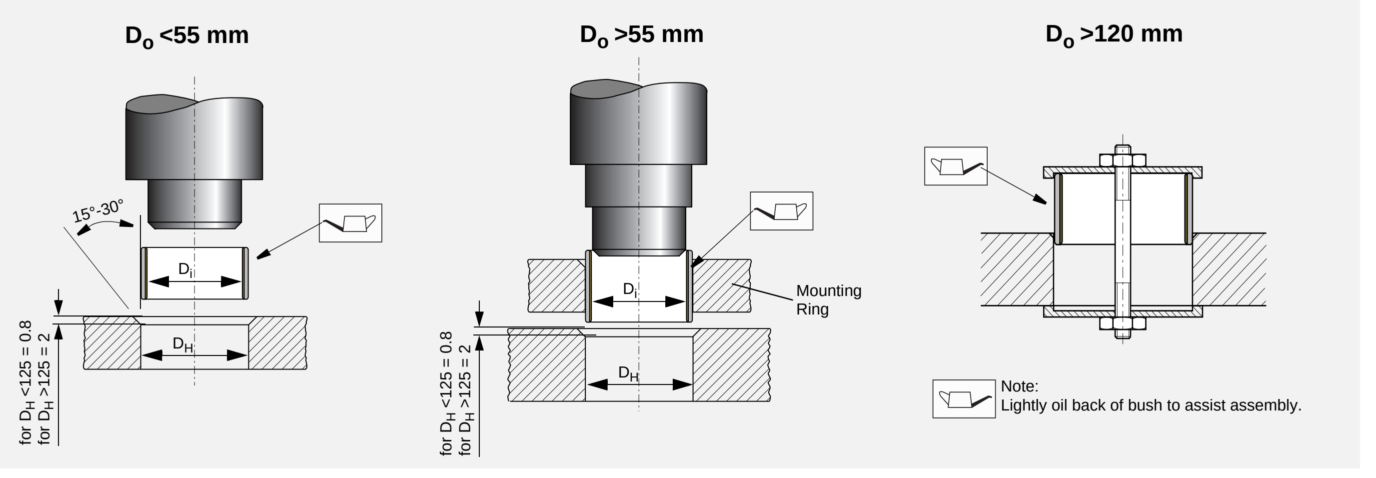

Fig. 32: Fitting of cylindrical bushes

Fitting of flanged bushes

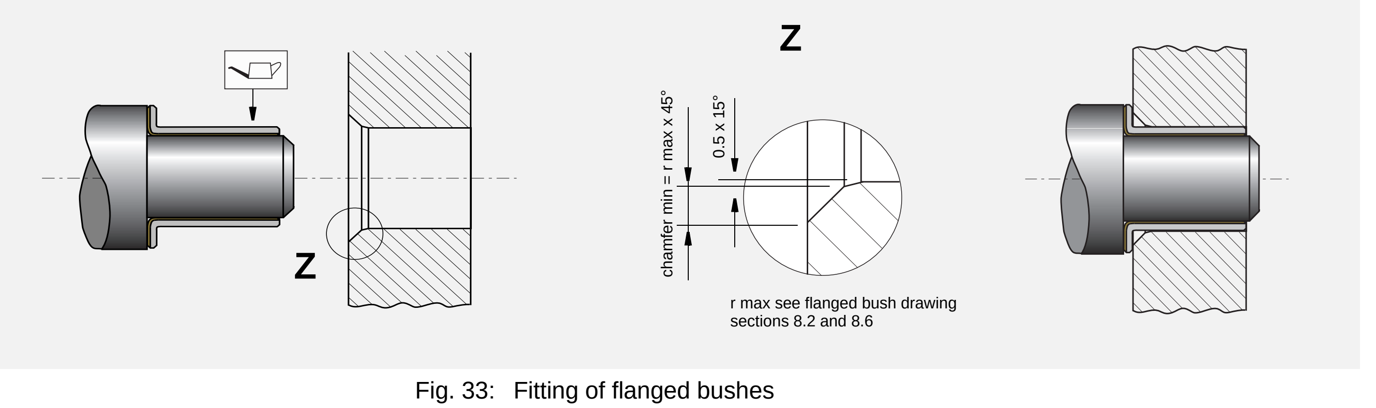

Fig. 33: Fitting of flanged bushes

Insertion Forces

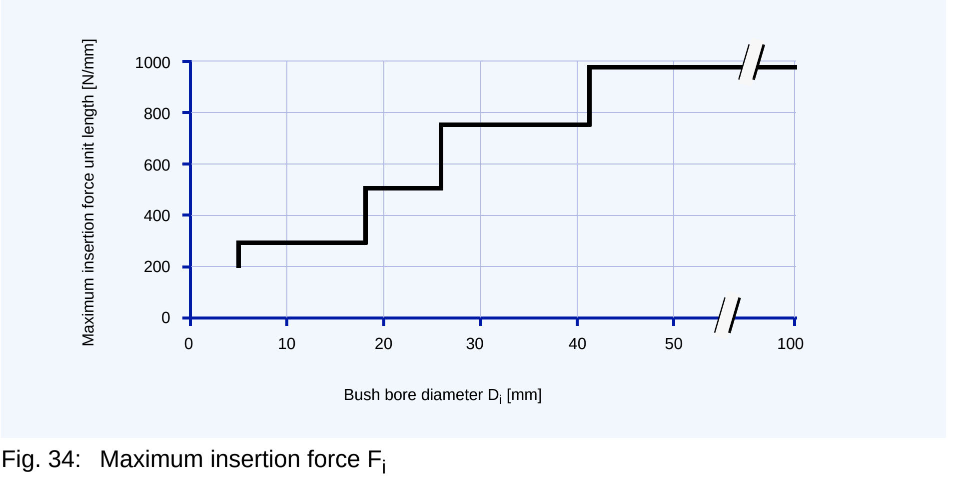

Fig. 34: Maximum insertion force F_i

Alignment

Accurate alignment is an important consideration for all bearing assemblies. With DP4 bearings misalignment over the length of a bush (or pair of bushes), or over the diameter of a thrust washer should not exceed 0.020 mm as illustrated in Fig. 35.

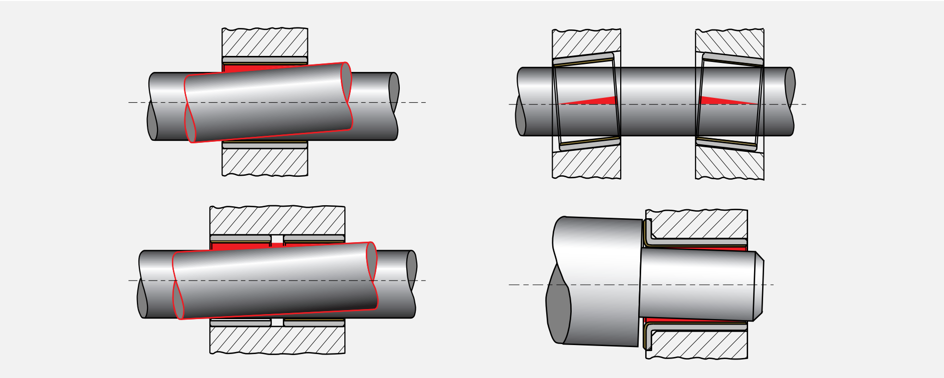

Fig. 35: Alignment

Sealing

While DP4 can tolerate the ingress of some contaminant materials into the bearing without loss of performance, where there is the possibility of highly abrasive material entering the bearing, a suitable sealing arrangement, as illustrated in Fig. 36 should be provided.

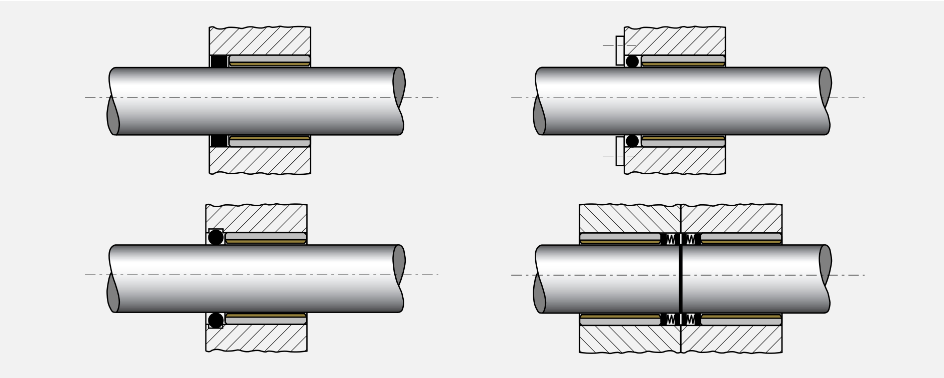

Fig. 36: Recommended sealing arrangements

6.5 Axial Location

Where axial location is necessary, it is advisable to fit DP4 thrust washers in conjunction with DP4 bushes, even when the axial loads are low.

Fitting of Thrust Washers

DP4 thrust washers should be located in a recess as shown in Fig. 37. For the recess diameter the tolerance class [D10] is recommended. The recess depth is given in the product tables, page 40 and following.

If a recess is not possible one of the following methods may be used:

- Two dowel pins
- Two screws
- Adhesive
- Soldering (temperature <320 °C).

Important Note

- Ensure the washer ID does not touch the shaft after assembly
- Ensure that the washer is mounted with the steel/bronze backing to the housing
- Dowels pins should be recessed 0.25 mm below the bearing surface
- Screws should be countersunk 0.25 mm below the bearing surface
- DP4 must not be heated above 320 °C
- Contact adhesive manufacturers for guidance selection of suitable adhesives
- Protect the bearing surface to prevent contact with adhesive.

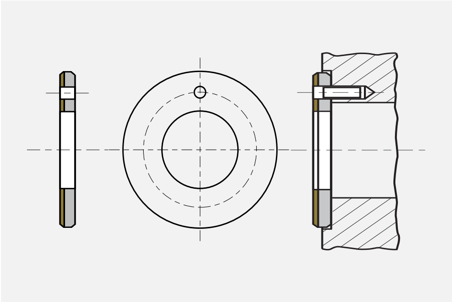

Fig. 37: Installation of Thrust-Washer

Grooves for Wear Debris Removal

Tests with thrust washers have demonstrated that for optimum dry wear performance at specific loads in excess of 35 MPa, four wear debris removal grooves should be machined in the bearing surface as shown in Fig. 38.

Grooves in bushes have not been found to be beneficial in this respect.

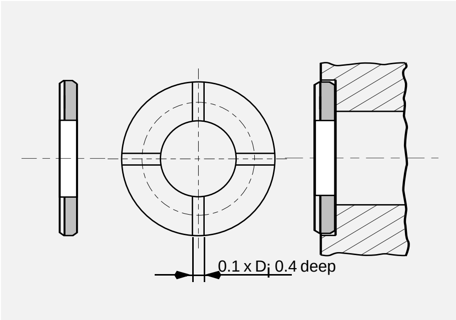

Fig. 38: Debris removal Grooves

Slideways

DP4 strip material for use as slideway bearings should be installed using one of the following methods:

- Countersunk screws
- Adhesives
- Mechanical location as shown in Fig. 39.

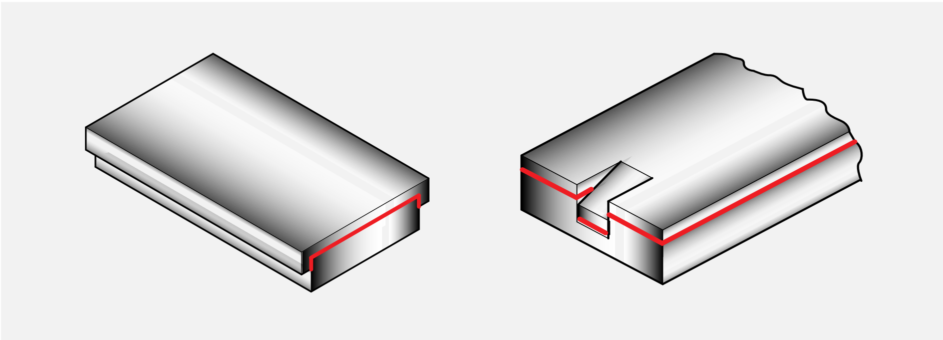

Fig. 39: Mechanical location of DP4 slideplates

7 Modification

7.1 Cutting and Machining

The modification of DP4 bearing components requires no special procedures. In general it is more satisfactory to perform machining or drilling operations from the PTFE side in order to avoid burrs. When cutting is done from the steel side, the minimum cutting pressure should be used and care taken to ensure that any steel or bronze particles protruding into the remaining bearing material, and all burrs, are removed.

Drilling Oil Holes

Bushes should be adequately supported during the drilling operation to ensure that no distortion is caused by the drilling pressure.

Cutting Strip Material

DP4 strip material may be cut to size by any one of the following methods.

Care must be taken to protect the bearing surface from damage and to ensure that no deformation of the strip occurs:

- Using side and face cutter, or slitting saw, with the strip held flat and securely on a horizontal milling machine.
- Cropping
- Guillotine (For widths less than 90 mm only)
- Water-jet cutting
- Laser cutting (see Health Warning).

7.2 Electroplating

DP4 Components

In order to provide some protection in mildly corrosive environments the steel back and end faces of standard range DP4 bearings are tin flashed.

DP4 can be electroplated with most of the conventional electroplating metals including the following:

- zinc ISO 2081
- nickel ISO 1456
- hard chromium ISO 1456.

For the harder materials if the specified plating thickness exceeds approximately 5 µm then the housing diameter should be increased by twice the plating thickness in order to maintain the correct assembled bearing bore size.

Where electrolytic attack is possible tests should be conducted to ensure that all the materials in the bearing environment are mutually compatible.

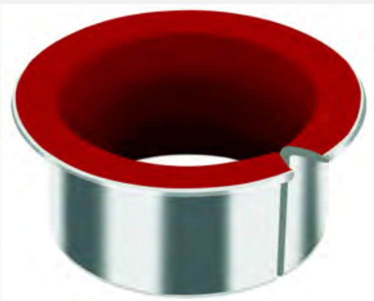
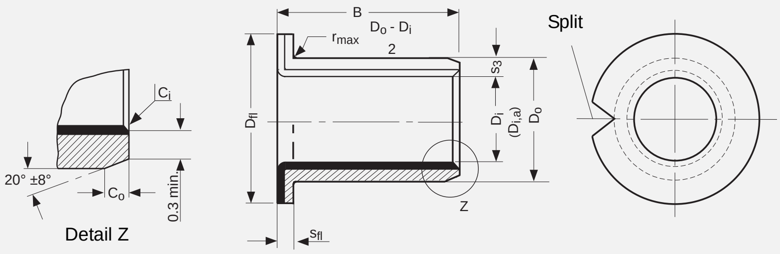
8.2 DP4 Flanged bushes





Dimensions and Tolerances according to ISO 3547 and GGB-Specifications

All dimensions in mm

Outside C_O and Inside C_i chamfers

Wall thickness s_3	C_O (a) machined	C_O (a) rolled	C_i (b)
0.75	0.5 ± 0.3	0.5 ± 0.3	-0.1 to -0.4
1	0.6 ± 0.4	0.6 ± 0.4	-0.1 to -0.5
1.5	0.6 ± 0.4	0.6 ± 0.4	-0.1 to -0.7

Wall thickness s_3	C_O (a) machined	C_O (a) rolled	C_i (b)
2	1.2 ± 0.4	1.0 ± 0.4	-0.1 to -0.7
2.5	1.8 ± 0.6	1.2 ± 0.4	-0.2 to -1.0

a = Chamfer C_O machined or rolled at the option of the manufacturer

b = C_i can be a radius or a chamfer in accordance with ISO 13715

9 Test Methods

9.1 Measurement of Wrapped Bushes

It is not possible to accurately measure the external and internal diameters of a wrapped bush in the free condition. In its free state a wrapped bush will not be perfectly cylindrical and the butt joint may be open. When correctly installed in a housing the butt joint will be tightly closed and the bush will conform to the housing. For this reason the external diameter and internal diameter of a wrapped bush can only be checked with special gauges and test equipment.

The checking methods are defined in ISO 3547 Part 1 to 7.

Test A of ISO 3547 Part 2

Checking the external diameter in a test machine with checking blocks and adjusting mandrel.

Test A of ISO 3547 Part 2 on 2015DP4	
Checking block and setting mandrel $d_{ch,1}$	23.062 mm
Test force F_{ch}	4500 N
Limits for Δz	0 and -0.065 mm
Bush Outside diameter D_o	23.035 to 23.075 mm

Table 18: Test A of ISO 3547 Part 2

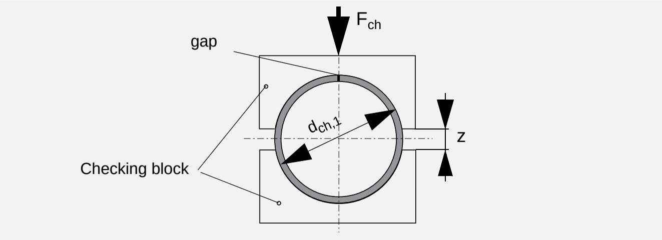

Fig. 40: Test A, Data for drawing

Test B (alternatively to Test A)

Check external diameter with GO and NO GO ring gauges.

Test C

Checking the internal diameter of a bush pressed into a ring gauge, which nominal diameter corresponds to the dimension specified in table 6 of ISO 3547 Part 1.

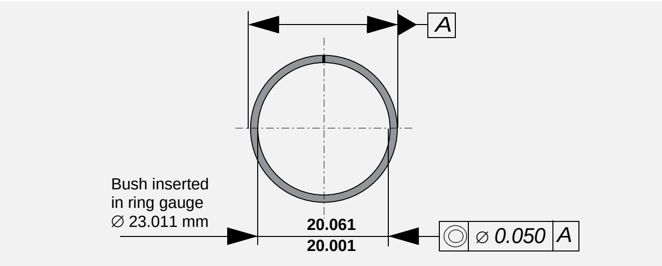

Fig. 41: Test C, Data for drawing (example D_i = 20 mm)

Measurement of Wall Thickness (alternatively to Test C)

The wall thickness is measured at one, two or three positions axially according to the bearing dimensions.

B [mm]	X [mm]	Measurement position
≤ 15	B/2	1
>15 ≤ 50	4	2
>50 ≤ 90	6 and B/2	3
>90	8 and B/2	3

Table 19: Measurement position for wall thickness

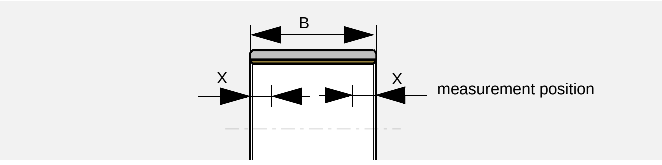

Fig. 42: Wall thickness measurement position

Test D

Check external diameter by precision measuring tape.

Dimensions in mm

Inside Diameter	D_i	
Outside Diameter	D_o	
Length	B	
Flange Diameter	D_{fl}	
Flange Thickness	s_{fl}	
Length of slideplate	L	
Width of slideplate	W	
Thickness of slideplate	s_S	

Load

Radial load	F [N]	
Axial load	F [N]	

Movement

Rotational speed	n [1/min]	
Speed	v [m/s]	
Length of Stroke	L_S [mm]	
Frequency of Stroke	[1/min]	
Angular displacement	φ [°]	
Oscillating frequency	n_{osc} [1/min]	

Service hours per day

Continuous operation	[h]	
Intermittent operation	[h]	

Fits and Tolerances

Housing (Ø, tolerance)	D_H	
Shaft (Ø, tolerance)	D_J	

Mating surface

Material		
Hardness	HB/HRC	
Surface roughness	R_a [μm]	

Operating Environment

Temperature - ambient	T_{amb}	
Temperature - min/max	T_{min}/T_{max}	

Housing material

Assembly with good heat transfer properties ☐

Assembly with poor heat transfer properties ☐

Dry operation ☐ With lubricant ☐

If grease, type with technical datasheet

If oil, type with technical datasheet

- Oil splash ☐
- Oil bath ☐
- Oil circulation ☐

Service life

Required service life	L_H [h]	

Formula Symbols and Designations

Formula Symbol	Unit	Designation
A	mm²	Surface area of DP4 bearing
A_M	mm²	Surface area of mating surface in contact with DP4 bearing (slideway)
a_B	-	Bearing size factor
a_C	-	Application factor for bore burnishing
a_E	-	High load factor
a_{E1}	-	Specific load factor (slideways)
a_{E2}	-	Speed, temperature and material factor (slideways)
a_{E3}	-	Relative contact area factor (slideways)
a_L	-	Life correction constant
a_M	-	Mating surface material factor
a_T	-	Temperature application factor
B	mm	Nominal bush width
C	1/min	Dynamic load frequency
C_D	mm	Installed diametral clearance
C_i	mm	Inside chamfer
C_o	mm	Outside chamfer
C_T	-	Total number of dynamic load cycles
D_C	mm	Diameter of burnishing tool
D_{fl}	mm	Nominal bush flange OD
D_H	mm	Housing diameter
D_i	mm	Nominal bush and thrust washer ID
$D_{i,a}$	mm	Bush ID when assembled in housing
D_J	mm	Shaft diameter
D_{Nth}	nvt	Max. thermal neutron dose
D_o	mm	Nominal bush and thrust washer OD
D_γ	Gy	Max. Gamma radiation dose G_y = J/kg
d_D	mm	Dowel hole diameter
d_L	mm	Oil hole diameter
d_P	mm	Pitch circle diameter for dowel hole
F	N	Bearing load
F_{ch}	N	Test load
F_i	N	Insertion force
f	-	Coefficient of friction
H_a	mm	Depth of housing recess (e.g. for thrust washers)
H_d	mm	Diameter of housing recess (thrust washers)
L	mm	Strip length
L_H	h	Bearing service life
L_S	mm	Length of stroke (slideway)
n	1/min	Rotational speed
n_E	1/min	Equivalent rotational speed for oscillating movement
n_{osc}	1/min	Oscillating movement frequency
p	MPa	Specific load
p_{lim}	MPa	Specific load limit
$p_{sta,max}$	MPa	Maximum static load
$p_{dyn,max}$	MPa	Maximum dynamic load
Q	-	Number of load/movement cycles
R_a	µm	Surface roughness (DIN 4768, ISO/DIN 4287/1)
R_{OB}	Ω	Electrical resistance
s_3	mm	Bush wall thickness
s_{fl}	mm	Flange thickness
s_S	mm	Strip thickness
s_T	mm	Thrust washer thickness
T	°C	Temperature
T_{amb}	°C	Ambient temperature
T_{max}	°C	Maximum temperature
T_{min}	°C	Minimum temperature
v	m/s	Sliding speed
W	mm	Strip width
$W_{u\ min}$	mm	Minimum usable strip width
Z_T	-	Total number of cycles
α_1	10^{-6}/K	Coefficient of linear thermal expansion parallel to surface
α_2	10^{-6}/K	Coefficient of linear thermal expansion normal to surface
σ_c	MPa	Compressive yield strength
λ	W/mK	Thermal conductivity
φ	°	Angular displacement
η	cP	Dynamic viscosity

Product Information

GGB gives an assurance that the products described in this document have no manufacturing errors or material deficiencies.

The details set out in this document are registered to assist in assessing the material's suitability for the intended use. They have been developed from our own investigations as well as from generally accessible publications. They do not represent any assurance for the properties themselves.

Unless expressly declared in writing, GGB gives no warranty that the products described are suited to any particular purpose or specific operating circumstances. GGB accepts no liability for any losses, damages or costs however they may arise through direct or indirect use of these products.

GGB's sales and delivery terms and conditions, included as an integral part of quotations, stock and price lists, apply absolutely to all business conducted by GGB. Copies can be made available on request.

Products are subject to continual development. GGB retains the right to make specification amendments or improvements to the technical data without prior announcement.

Edition 2012 (This edition replaces earlier editions which hereby lose their validity).

Declaration on lead contents of GGB products/compliance with EU law

Since July 1, 2006 it has been prohibited under Directive 2011/65/EU (restriction of the use of certain hazardous substances in electrical and electronic equipment; ROHS Directive) to put products on the market that contain lead, mercury, cadmium, hexavalent chromium, polybrominated biphenyls (PBB) or polybrominated diphenyl ethers (PBDE). Certain applications listed in the annex to the ROHS Directive are exempted. A maximum concentration value of 0.01% by weight and per homogeneous material, for cadmium and of 0.1% by weight and per homogeneous material, for lead, mercury, hexavalent chromium, PBB and PBDE shall be tolerated.

According to Directive 2011/65/EU on end-of life vehicles, since July 1, 2003 it has been prohibited to put on the market materials and components that contain lead, mercury, cadmium or hexavalent chromium. Due to an exceptional provision, lead-containing bearing shells and bushes could still be put on the market up until July 1, 2008. This general exception expired on July 1, 2008. A maximum concentration value of up to 0.1% by weight and per homogeneous material, for lead, hexavalent chromium and mercury shall be tolerated.

All products of GGB, with the exception of DU®, DU-B™, DB™, PICAL2™, SY™, SP™, GGB-CSM™115, GGB-CSM™118, GGB-CSM™124, GGB-CSM™125, GGB-CBM™311, GGB-CBM™312, GGB-CBM™322, GGB-CBM™341 and GGB-CBM™342 satisfy these requirements of 2011/65/EU from 08.06.2011 (ROHS Directive).

All products manufactured by GGB are also compliant with REACH Regulation (EC) No. 1 907/2006 of December 18, 2006.

Health Hazard - Warning

Fabrication

At temperatures up to 250 °C the polytetrafluroethylene (PTFE) present in the lining material is completely inert so that even on the rare occasions in which DP4 bushes are drilled, or sized, after assembly there is no danger in boring or burnishing.

At higher temperatures however, small quantities of toxic fumes can be produced and the direct inhalation of these can cause an influenza type of illness which may not appear for some hours but which subsides without after-effects in 24-48 hours.

Such fumes can arise from PTFE particles picked up on the end of a cigarette. Therefore smoking should be prohibited where DP4 is being machined.
